(54) Title: SULFONE AMIDE LINKED BENZOTHIAZOLE INHIBITORS OF ENDOTHELIAL LIPASE

(57) Abstract: The present invention provides compounds of Formula (I) as defined in the specification and compositions comprising any of such novel compounds. These compounds are endothelial lipase inhibitors which may be used medicaments.

SULFONE AMIDE LINKED BENZOTHIAZOLE INHIBITORS  
OF ENDOTHELIAL LIPASE

FIELD OF THE INVENTION

5 [0001] The present invention provides novel sulfone amide linked benzothiazole compounds and analogues, which are endothelial lipase (EL) inhibitors, compositions containing them, and methods of using them, for example, for the treatment and/or prophylaxis of dyslipidemias and the sequelae thereof.

10 BACKGROUND OF THE INVENTION

[0002] Cardiovascular disease is a major health risk throughout the industrialized world. Atherosclerosis, the most prevalent of cardiovascular diseases, is the principal cause of heart attack, and stroke, and thereby the principal cause of death in the United States.

15 [0003] Atherosclerosis is a complex disease involving many cell types and molecular factors (for a detailed review, see Ross, R., *Nature*, 362(6423):801-809 (1993)). Results from epidemiologic studies have clearly established an inverse relationship between levels of high density lipoprotein (HDL), which transports endogenous cholesterol from tissues to the liver as well as mediating selective cholesteryl ester delivery to 20 steroidogenic tissues, and the risk for atherosclerosis (Gordon, D.J. et al., *N. Engl. J. Med.*, 321(19):1311-1316 (1989)).

[0004] The metabolism of HDL is influenced by several members of the phospholipase and triacylglycerol (TG) lipase family of proteins, which hydrolyze triglycerides, phospholipids (PL), and cholesteryl esters (CE), generating fatty acids to 25 facilitate intestinal absorption, energy production, or storage. Of the TG lipases, lipoprotein lipase (LPL) influences the metabolism of HDL cholesterol by hydrolyzing triglycerides in triglyceride-rich lipoproteins, resulting in the transfer of lipids and apolipoproteins to HDL and is responsible for hydrolyzing chylomicron and very low density lipoprotein (VLDL) in muscle and adipose tissues. Hepatic lipase (HL) 30 hydrolyzes HDL triglyceride and phospholipids, generating smaller, lipid-depleted HDL particles, and plays a role in the uptake of HDL cholesterol (Jin, W. et al., *Trends Endocrinol. Metab.*, 13(4):174-178 (2002); Wong, H. et al., *J. Lipid Res.*, 43:993-999

(2002)). Endothelial lipase (also known as EDL, EL, LIPG, endothelial-derived lipase, and endothelial cell-derived lipase) is synthesized in endothelial cells, a characteristic that distinguishes it from the other members of the family.

- [0005] Recombinant endothelial lipase protein has substantial phospholipase activity but has been reported to have less hydrolytic activity toward triglyceride lipids (Hirata, K. et al., *J. Biol. Chem.*, 274(20):14170-14175 (1999); Jaye, M. et al., *Nat. Genet.*, 21:424-428 (1999)). However, endothelial lipase does exhibit triglyceride lipase activity *ex vivo* in addition to its HDL phospholipase activity, and endothelial lipase was found to hydrolyze HDL more efficiently than other lipoproteins (McCoy, M.G. et al., *J. Lipid Res.*, 43:921-929 (2002)). Overexpression of the human endothelial lipase gene in the livers of mice markedly reduces plasma concentrations of HDL cholesterol and its major protein, apolipoprotein A-I (apoA-I) (Jaye, M. et al., *Nat. Genet.*, 21:424-428 (1999)).
- [0006] Various types of compounds have been reported to modulate the expression of endothelial lipase, for example, 3-oxo-1,3-dihydro-indazole-2-carboxamides (WO 2004/093872, US 2006/0211755 A1), 3-oxo-3-H-benzo[d]isoxazole-2-carboxamides (WO 2004/094393, U.S. Patent No. 7,217,727), and benzisothiazol-3-one-2-carboxamides (WO 2004/094394, U.S. Patent No. 7,595,403) by Eli Lilly & Co.; diacylindazole derivatives (WO 2007/042178, US 2008/0287448 A1) and imidazopyridin-2-one derivatives (WO 2007/110215, US 2009/0076068 A1), and 20 azolopyridin-3-one derivatives (WO 2007/110216, US 2009/0054478 A1) by Sanofi-Aventis; heterocyclic derivatives (WO 2009/123164), keto-amide derivatives (WO 2009/133834), acetic acid amide derivatives (WO 2010/44441, US 2011/0251386 A1), oxadiazole derivatives (WO 2011/074560, US 2012/253040 A1), benzothiazole and azabenzothiazole derivatives (WO 2012/081563) and amino derivatives (WO 2012/173099) by Shionogi & Co., Ltd. However, because endothelial lipase is a relatively new member in the lipase gene family, a full understanding of the potential of endothelial lipase inhibitors to human health, as well as the inhibitors of other lipases in general, requires more studies.
- [0007] Thus, there is a clear need for new types of compounds capable of inhibiting the activity of lipases, particularly endothelial lipase, that would constitute effective treatments to the diseases or disorders associated with the activity of such lipases.

### III. CHEMISTRY

- [0050] Throughout the specification and the appended claims, a given chemical formula or name shall encompass all stereo and optical isomers and racemates thereof where such isomers exist. Unless otherwise indicated, all chiral (enantiomeric and diastereomeric) and racemic forms are within the scope of the invention. Many geometric isomers of C=C double bonds, C=N double bonds, ring systems, and the like can also be present in the compounds, and all such stable isomers are contemplated in the present invention. *Cis-* and *trans-* (or *E-* and *Z-*) geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. The present compounds can be isolated in optically active or racemic forms. Optically active forms may be prepared by resolution of racemic forms or by synthesis from optically active starting materials. All processes used to prepare compounds of the present invention and intermediates made therein are considered to be part of the present invention. When enantiomeric or diastereomeric products are prepared, they may be separated by conventional methods, for example, by chromatography or fractional crystallization. Depending on the process conditions the end products of the present invention are obtained either in free (neutral) or salt form.
- 25 Both the free form and the salts of these end products are within the scope of the invention. If so desired, one form of a compound may be converted into another form. A free base or acid may be converted into a salt; a salt may be converted into the free

compound or another salt; a mixture of isomeric compounds of the present invention may be separated into the individual isomers. Compounds of the present invention, free form and salts thereof, may exist in multiple tautomeric forms, in which hydrogen atoms are transposed to other parts of the molecules and the chemical bonds between the atoms of 5 the molecules are consequently rearranged. It should be understood that all tautomeric forms, insofar as they may exist, are included within the invention.

[0051] As used herein, the term "alkyl" or "alkylene" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms. For example, "C<sub>1</sub> to C<sub>10</sub> alkyl" or "C<sub>1-10</sub> alkyl" (or alkylene), is 10 intended to include C<sub>1</sub>, C<sub>2</sub>, C<sub>3</sub>, C<sub>4</sub>, C<sub>5</sub>, C<sub>6</sub>, C<sub>7</sub>, C<sub>8</sub>, C<sub>9</sub>, and C<sub>10</sub> alkyl groups. Additionally, for example, "C<sub>1</sub> to C<sub>6</sub> alkyl" or "C<sub>1-6</sub> alkyl" denotes alkyl having 1 to 6 carbon atoms. Alkyl group can be unsubstituted or substituted with at least one hydrogen being replaced by another chemical group. 10 tricyclic ring. When a ring is bridged, the substituents recited for the ring may also be present on the bridge.

[0059] As used herein, the term "bicyclic carbocycle" or "bicyclic carbocyclic group" is intended to mean a stable 9- or 10-membered carbocyclic ring system that contains two fused rings and consists of carbon atoms. Of the two fused rings, one ring is a benzo ring  
15 fused to a second ring; and the second ring is a 5- or 6-membered carbon ring which is saturated, partially unsaturated, or unsaturated. The bicyclic carbocyclic group may be attached to its pendant group at any carbon atom which results in a stable structure. The bicyclic carbocyclic group described herein may be substituted on any carbon if the resulting compound is stable. Examples of a bicyclic carbocyclic group are, but not  
20 limited to, naphthyl, 1,2-dihydronaphthyl, 1,2,3,4-tetrahydronaphthyl, and indanyl.

[0060] "Aryl" groups refer to monocyclic or polycyclic aromatic hydrocarbons, including, for example, phenyl, naphthyl, and phenanthranyl. - [0062] As used herein, the term "heterocycle", "heterocyclyl", or "heterocyclic group" is intended to mean a stable 3-, 4-, 5-, 6-, or 7-membered monocyclic or bicyclic or 7-, 8-, 9-, 10-, 11-, 12-, 13-, or 14-membered polycyclic heterocyclic ring that is saturated, partially unsaturated, or fully unsaturated, and that contains carbon atoms and 1, 2, 3 or 4 heteroatoms independently selected from the group consisting of N, O and S; and including any polycyclic group in which any of the above-defined heterocyclic rings is fused to a benzene ring. The nitrogen and sulfur heteroatoms may optionally be oxidized (i.e., N→O and S(O)<sub>p</sub>, wherein p is 0, 1 or 2). The nitrogen atom may be substituted or unsubstituted (i.e., N or NR wherein R is H or another substituent, if defined). It is preferred that when the total number of S and O atoms in the heterocycle exceeds 1, then these heteroatoms are not adjacent to one another. It is preferred that the total number of S and O atoms in the heterocycle is not more than 1. When the term "heterocycle" is used, it is intended to include heteroaryl.

Also included are fused ring and spiro compounds containing, for example, the above heterocycles.

**[0066]** As used herein, the term "bicyclic heterocycle" or "bicyclic heterocyclic group" is intended to mean a stable 9- or 10-membered heterocyclic ring system which 30 contains two fused rings and consists of carbon atoms and 1, 2, 3, or 4 heteroatoms independently selected from the group consisting of N, O and S. Of the two fused rings, one ring is a 5- or 6-membered monocyclic aromatic ring comprising a 5-membered

heteroaryl ring, a 6-membered heteroaryl ring or a benzo ring, each fused to a second ring. The second ring is a 5- or 6-membered monocyclic ring which is saturated, partially unsaturated, or unsaturated, and comprises a 5-membered heterocycle, a 6-membered heterocycle or a carbocycle (provided the first ring is not benzo when the second ring is a carbocycle).

5 [0067] The bicyclic heterocyclic group may be attached to its pendant group at any heteroatom or carbon atom which results in a stable structure. The bicyclic heterocyclic group described herein may be substituted on carbon or on a nitrogen atom if the resulting compound is stable. It is preferred that when the total number of S and O atoms 10 in the heterocycle exceeds 1, then these heteroatoms are not adjacent to one another. It is preferred that the total number of S and O atoms in the heterocycle is not more than 1.

[0068] Examples of a bicyclic heterocyclic group are, but not limited to, quinolinyl, isoquinolinyl, phthalazinyl, quinazolinyl, indolyl, isoindolyl, indolanyl, 1H-indazolyl, benzimidazolyl, 1,2,3,4-tetrahydroquinolinyl, 1,2,3,4-tetrahydroisoquinolinyl, 15 5,6,7,8-tetrahydro-quinolinyl, 2,3-dihydro-benzofuranyl, chromanyl, 1,2,3,4-tetrahydro-quinoxalinyl, and 1,2,3,4-tetrahydro-quinazolinyl.

[0069] As used herein, the term "aromatic heterocyclic group" or "heteroaryl" is intended to mean stable monocyclic and polycyclic aromatic hydrocarbons that include at least one heteroatom ring member such as sulfur, oxygen, or nitrogen. Heteroaryl groups 20 include, without limitation, pyridyl, pyrimidinyl, pyrazinyl, pyridazinyl, triazinyl, furyl, quinolyl, isoquinolyl, thienyl, imidazolyl, thiazolyl, indolyl, pyrrolyl, oxazolyl, benzofuryl, benzothienyl, benzthiazolyl, isoxazolyl, pyrazolyl, triazolyl, tetrazolyl, indazolyl, 1,2,4-thiadiazolyl, isothiazolyl, purinyl, carbazolyl, benzimidazolyl, indolanyl, benzodioxolanyl, and benzodioxane. Heteroaryl groups are substituted or unsubstituted. 25 The nitrogen atom is substituted or unsubstituted (*i.e.*, N or NR wherein R is H or another substituent, if defined). The nitrogen and sulfur heteroatoms may optionally be oxidized (*i.e.*, N→O and S(O)<sub>p</sub>, wherein p is 0, 1 or 2).

[0070] Bridged rings are also included in the definition of heterocycle. A bridged ring occurs when one or more, preferably one to three, atoms (*i.e.*, C, O, N, or S) link two 30 non-adjacent carbon or nitrogen atoms. Examples of bridged rings include, but are not limited to, one carbon atom, two carbon atoms, one nitrogen atom, two nitrogen atoms, and a carbon-nitrogen group. It is noted that a bridge always converts a monocyclic ring

into a tricyclic ring. When a ring is bridged, the substituents recited for the ring may also be present on the bridge.

[0071] The term "counter ion" is used to represent a negatively charged species such as chloride, bromide, hydroxide, acetate, and sulfate.

5 [0072] When a dotted ring is used within a ring structure, this indicates that the ring structure may be saturated, partially saturated or unsaturated.

[0073] As referred to herein, the term "substituted" means that at least one hydrogen atom is replaced with a non-hydrogen group, provided that normal valencies are maintained and that the substitution results in a stable compound. When a substituent is 10 keto (*i.e.*, =O), then 2 hydrogens on the atom are replaced. Keto substituents are not present on aromatic moieties. When a ring system (*e.g.*, carbocyclic or heterocyclic) is said to be substituted with a carbonyl group or a double bond, it is intended that the carbonyl group or double bond be part (*i.e.*, within) of the ring. Ring double bonds, as used herein, are double bonds that are formed between two adjacent ring atoms (*e.g.*, 15 C=C, C=N, or N=N).

[0074] In cases wherein there are nitrogen atoms (*e.g.*, amines) on compounds of the present invention, these may be converted to N-oxides by treatment with an oxidizing agent (*e.g.*, mCPBA and/or hydrogen peroxides) to afford other compounds of this invention. Thus, shown and claimed nitrogen atoms are considered to cover both the 20 shown nitrogen and its N-oxide (N→O) derivative.

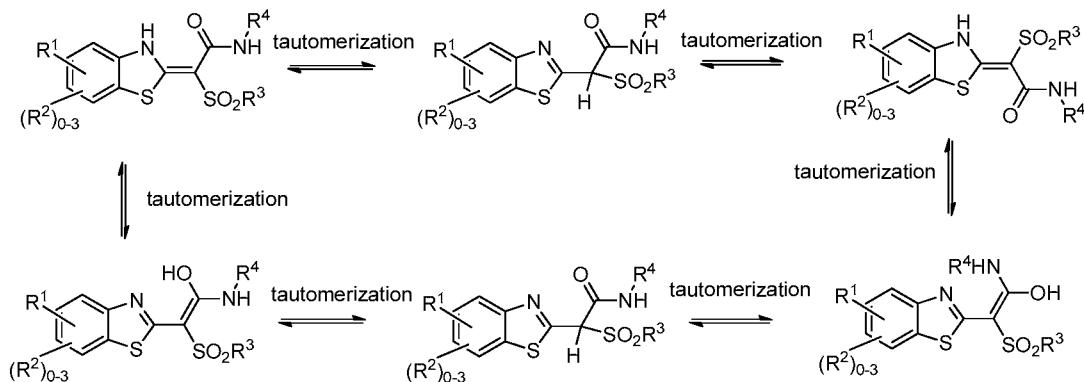

[0075] When any variable occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0-3 R groups, then said group may optionally be substituted with up to three R groups, 25 and at each occurrence R is selected independently from the definition of R.

[0076] Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

[0077] When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When a 30 substituent is listed without indicating the atom in which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any

atom in such substituent. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

- [0078] As a person of ordinary skill in the art would be able to understand that imine and carbonyl groups in a molecule may tautomerize to their enamine and enol forms, and 5 the double bond can exist as geometrical (E and Z) isomers as shown in the following equation, wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> are as defined above:

[0079] Thus, this disclosure is intended to cover all possible tautomers even when a structure depicts only one of them.

- 10 [0080] The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms that are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, and/or other problem or complication, commensurate with a reasonable benefit/risk ratio.
- 15 [0081] As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic groups such as amines; and alkali or organic salts of acidic groups such as carboxylic acids. The pharmaceutically acceptable salts include 20 the conventional non-toxic salts or the quaternary ammonium salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, and nitric; and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, 25 malic, tartaric, citric, ascorbic, pamoic, maleic, hydroxymaleic, phenylacetic, glutamic,

benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, and isethionic.

[0082] The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound that contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in Allen, L.V., Jr. et al., eds., *Remington: The Science and Practice of Pharmacy*, 22nd Edition, Pharmaceutical Press, London, UK (2012), the disclosure of which is hereby incorporated by reference.

[0083] In addition, compounds of Formula (I), Formula (II), or Formula (III) may have prodrug forms. Such compounds have a variety of potential uses, *e.g.*, as standards and reagents in determining the ability of a potential pharmaceutical compound to bind to target proteins or receptors, or for imaging compounds of this invention bound to biological receptors *in vivo* or *in vitro*.

[0087] "Stable compound" and "stable structure" are meant to indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent. It is preferred that

The solvent molecules in the solvate may be present in a regular arrangement and/or a non-ordered arrangement. The solvate may comprise either a stoichiometric or nonstoichiometric amount of the solvent molecules. "Solvate" encompasses both solution-phase and isolable solvates. Exemplary solvates include, but are not limited to, hydrates, ethanolates, methanolates, and isopropanolates. Methods of solvation are generally known in the art.

## SYNTHESIS

- [0090] The compounds of the present invention can be prepared in a number of ways known to one skilled in the art of organic synthesis. The compounds of the present invention can be synthesized using the methods described below, together with synthetic methods known in the art of synthetic organic chemistry, or by variations thereon as appreciated by those skilled in the art. Preferred methods include, but are not limited to, those described below. The reactions are performed in a solvent or solvent mixture appropriate to the reagents and materials employed and suitable for the transformations being affected. It will be understood by those skilled in the art of organic synthesis that the functionality present on the molecule should be consistent with the transformations proposed. This will sometimes require a judgment to modify the order of the synthetic steps or to select one particular process scheme over another in order to obtain a desired compound of the invention.
- [0091] A particularly useful compendium of synthetic methods which may be applicable to the preparation of compounds of the present invention may be found in Larock, R.C., *Comprehensive Organic Transformations*, VCH, New York (1989). Preferred methods include, but are not limited to, those described below. All references cited herein are hereby incorporated in their entirety herein by reference.
- [0092] The novel compounds of this invention may be prepared using the reactions and techniques described in this section. Also, in the description of the synthetic methods described below, it is to be understood that all proposed reaction conditions, including choice of solvent, reaction atmosphere, reaction temperature, duration of the experiment and workup procedures, are chosen to be the conditions standard for that reaction, which

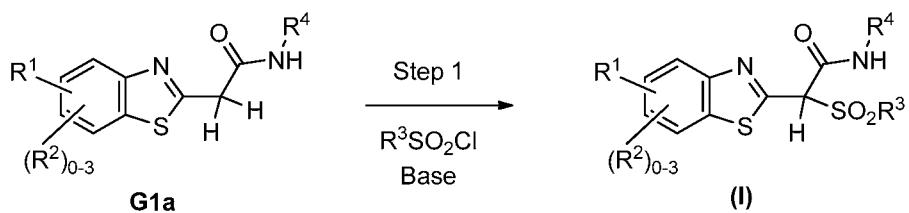

should be readily recognized by one skilled in the art. Restrictions to the substituents that are compatible with the reaction conditions will be readily apparent to one skilled in the art and alternate methods must then be used.

[0093] It will also be recognized that another major consideration in the planning of  
5 any synthetic route in this field is the judicious choice of the protecting group used for  
protection of the reactive functional groups present in the compounds described in this  
invention. An authoritative account describing the many alternatives to the trained  
practitioner is Greene et al., (*Protective Groups in Organic Synthesis*, Wiley and Sons  
(1991)).

#### NMR Employed in Characterization of Examples

[00127]  $^1\text{H}$  NMR spectra were obtained with Bruker or JEOL<sup>®</sup> Fourier transform spectrometers operating at frequencies as follows:  $^1\text{H}$  NMR: 400 MHz (Bruker or JEOL<sup>®</sup>) or 500MHz (JEOL<sup>®</sup>).  $^{13}\text{C}$  NMR: 100 MHz (Bruker or JEOL<sup>®</sup>). Spectra data are reported in the format: chemical shift (multiplicity, coupling constants, number of hydrogens). Chemical shifts are specified in ppm downfield of a tetramethylsilane internal standard ( $\delta$  units, tetramethylsilane = 0 ppm) and/or referenced to solvent peaks, which in  $^1\text{H}$  NMR spectra appear at 2.49 ppm for CD<sub>2</sub>HSOCD<sub>3</sub>, 3.30 ppm for CD<sub>2</sub>HOD, and 7.24 ppm for CHCl<sub>3</sub>, and which in  $^{13}\text{C}$  NMR spectra appear at 39.7 ppm for CD<sub>3</sub>SOCD<sub>3</sub>, 49.0 ppm for CD<sub>3</sub>OD, and 77.0 ppm for CDCl<sub>3</sub>. All  $^{13}\text{C}$  NMR spectra were proton decoupled.

#### IV. BIOLOGY

[00128] The endothelium occupies a pivotal position at the interface between the circulating humoral and cellular elements of the blood, and the solid tissues which constitute the various organs. In this unique position, endothelial cells regulate a large number of critical processes, including leukocyte adherence and transit through the blood vessel wall, local control of blood vessel tone, modulation of the immune response, the balance between thrombosis and thrombolysis, and new blood vessel development. Thus, endothelial cell dysfunction has been postulated as a central feature of vascular diseases such as hypertension and atherosclerosis. (WO 1999/032611 and references cited therein, e.g., Folkman, J. et al., *Science*, 235:442-447 (1987); Yanagisawa, M. et al., *Nature*, 332(6163):411-415 (1988); Folkman, J. et al., *J. Biol. Chem.*, 267(16):10931-10934 (1992); Janssens, S.P. et al., *J. Biol. Chem.*, 267(21):14519-14522 (1992); Lamas, S. et al., *Proc. Natl. Acad. Sci. USA*, 89(14):6348-6352 (1992); Luscher, T.F. et al., *Hypertension*, 19(2):117-130 (1992); Williams et al., *Am. Rev. Respir. Dis.*, 146:S45-S50 (1992); and Bevilacqua, M.P. et al., *J. Clin. Invest.*, 91(2):379-387 (1993)).

- [00129] Atherosclerosis and its associated coronary artery disease (CAD) is the leading cause of mortality in the industrialized world. Despite attempts to modify secondary risk factors (smoking, obesity, lack of exercise) and treatment of dyslipidemia with dietary modification and drug therapy, coronary heart disease (CHD) remains the 5 most common cause of death in the U.S. In 2008, cardiovascular disease accounted for 33% of all deaths in the U.S., and ~1 of every 6 deaths were specifically caused by atherosclerotic coronary heart disease (*Circulation* 125:e2-e220 (2012)).
- [00130] Risk for development of atherosclerosis has been shown to be strongly correlated with certain plasma lipid levels. While elevated low density lipoprotein-10 cholesterol (LDL-C) may be the most recognized form of dyslipidemia, it is by no means the only significant lipid associated contributor to CHD. A low level of high density lipoprotein-cholesterol (HDL-C) is also a known risk factor for CHD (Gordon, D.J. et al., *Circulation*, 79(1):8-15 (1989)).
- [00131] High LDL-C and triglyceride levels are positively correlated, while high 15 levels of HDL-C are negatively correlated with the risk for developing cardiovascular diseases. Thus, dyslipidemia is not a unitary risk profile for CHD but may be comprised of one or more, preferably one to three, lipid aberrations.
- [00132] At least 50% of the variation in HDL cholesterol levels is genetically determined. The phenotype of elevated HDL cholesterol is often dominantly inherited, 20 but homozygous deficiency of HL or of the cholesteryl ester transfer protein (CETP), which result in elevated HDL cholesterol, are recessive conditions. Recently, several genetic variations in the human endothelial lipase gene have been identified, six of which potentially produce functional variants of the protein, and the frequencies of these variants were found to be associated with elevated levels of HDL cholesterol in human 25 subjects (deLemos, A.S. et al., *Circulation*, 106(11):1321-1326 (2002)). Notably, the endothelial lipase-mediated binding and uptake of HDL particles and the selective uptake of HDL-derived cholesterol esters have been reported to be independent of its enzymatic lipolytic activity (Strauss, J.G. et al., *Biochem. J.*, 368:69-79 (2002)).
- [00133] Because of the beneficial effects widely associated with elevated HDL levels, 30 an agent which inhibits EL activity in humans, by virtue of its HDL increasing ability, are expected to be useful for the treatment, prevention, the arrestment and/or regression of atherosclerosis, coronary heart disease, cerebrovascular disorders etc., especially those

(but not restricted thereto) which are characterized by one or more of the following factors: (a) high plasma triglyceride concentrations, high postprandial plasma triglyceride concentrations; (b) low HDL cholesterol concentration; (c) low apoA1 lipoprotein concentrations; (d) high LDL cholesterol concentrations; (e) high levels of small dense

5 LDL cholesterol particles; and (f) high apoB lipoprotein concentrations.

[00134] The term "modulator" refers to a chemical compound with capacity to either enhance (*e.g.*, "agonist" activity) or partially enhance (*e.g.*, "partial agonist" activity) or inhibit (*e.g.*, "antagonist" activity or "inverse agonist" activity) a functional property of biological activity or process (*e.g.*, enzyme activity or receptor binding); such enhancement or inhibition may be contingent on the occurrence of a specific event, such as activation of a signal transduction pathway, receptor internalization, and/or may be manifest only in particular cell types.

10

[00135] It is also desirable and preferable to find compounds with advantageous and improved characteristics compared with known anti-atherosclerosis agents, in one or 15 more of the following categories that are given as examples, and are not intended to be limiting: (a) pharmacokinetic properties, including oral bioavailability, half life, and clearance; (b) pharmaceutical properties; (c) dosage requirements; (d) factors that decrease blood drug concentration peak-to-trough characteristics; (e) factors that increase the concentration of active drug at the receptor; (f) factors that decrease the liability for 20 clinical drug-drug interactions; (g) factors that decrease the potential for adverse side-effects, including selectivity versus other biological targets; and (h) improved therapeutic index.

[00136] As used herein, the term "patient" encompasses all mammalian species.

[00137] As used herein, the term "subject" refers to any human or non-human 25 organism that could potentially benefit from treatment with an anti-atherosclerosis agent, *e.g.*, an endothelial lipase inhibitor. Exemplary subjects include human beings of any age with risk factors for atherosclerosis and its associated coronary artery disease. Common risk factors include, but are not limited to, age, sex, weight, and family history.

[00138] As used herein, "treating" or "treatment" cover the treatment of a disease-state 30 in a mammal, particularly in a human, and include: (a) inhibiting the disease-state, *i.e.*, arresting its development; and/or (b) relieving the disease-state, *i.e.*, causing regression of the disease state.

- [00139] As used herein, "prophylaxis" or "prevention" covers the preventive treatment of a subclinical disease-state in a mammal, particularly in a human, aimed at reducing the probability of the occurrence of a clinical disease-state. Patients are selected for preventative therapy based on factors that are known to increase risk of suffering a
- 5 clinical disease state compared to the general population. "Prophylaxis" therapies can be divided into (a) primary prevention and (b) secondary prevention. Primary prevention is defined as treatment in a subject that has not yet presented with a clinical disease state, whereas secondary prevention is defined as preventing a second occurrence of the same or similar clinical disease state.
- 10 [00140] As used herein, "risk reduction" covers therapies that lower the incidence of development of a clinical disease state. As such, primary and secondary prevention therapies are examples of risk reduction.
- [00141] "Therapeutically effective amount" is intended to include an amount of a compound of the present invention that is effective when administered alone or in
- 15 combination to inhibit endothelial lipase and/or to prevent or treat the disorders listed herein. When applied to a combination, the term refers to combined amounts of the active ingredients that result in the preventive or therapeutic effect, whether administered in combination, serially, or simultaneously.

20 BIOLOGICAL ACTIVITY

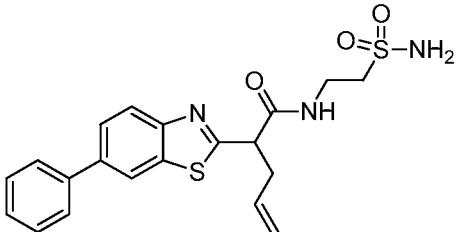

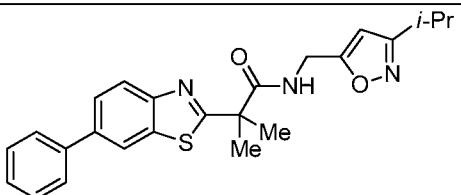

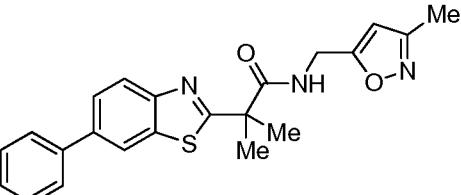

- [00142] Endothelial lipase (EL) and hepatic lipase (HL) activities were measured using a fluorescent substrate, A10070, (Invitrogen, CA) doped into an artificial vesicle containing DMPG (Avanti Polar Lipids) as the excipient. Vesicles were prepared by combining 571 µL of 29 mM DMPG in a 1:1 mixture of MeOH and CHCl<sub>3</sub> with 2000 µL of 1 mM A10070 in a 1:1 mixture of MeOH and CHCl<sub>3</sub>. The mixture was dried under nitrogen in multiple vials then resuspended in 20 mL total volume of 50 mM HEPES pH 8.0 buffer containing 50 mM NaCl and 0.2 mM EDTA. The sample was allowed to sit at room temperature for 15 min and then was sonicated 3 x 4 mins on ice with a Branson Sonicator using duty cycle 1. This preparation provides vesicles with a mole fraction of
- 25 0.11 for the FRET substrate.
- [00143] The enzymatic assay was measured using 384-well white Optiplates. Each well contained 20 µL of assay buffer (50 mM HEPES pH 8.0, 50 mM NaCl and 1 mM

CaCl<sub>2</sub>) and 0.25 µL of a DMSO solution containing a compound of interest. EL or HL (10 µL) was added and allowed to incubate with the compound for 30 min at 37 °C. The source of EL was conditioned media obtained from HT-1080 cells that were transformed using RAGE technology (Athersys) to overexpress endogenous EL, and HL was partially purified from conditioned media obtained from COS cells overexpressing HL. The reaction was started by the addition of 10 µL of a 1:10 dilution of vesicles. The final total reaction volume was 20.25 µL. The reaction rates were measured on a Gemini plate reader with an excitation wavelength of 490 nm and an emission wavelength of 530 nm. Readings were taken over a period of 60 minutes, and the slope between 300 and 900 10 secs of the readout was used to calculate the rate of the reaction.

## V. PHARMACEUTICAL COMPOSITIONS, FORMULATIONS AND COMBINATIONS

[00147] The compounds of this invention can be administered for any of the uses described herein by any suitable means, for example, orally, such as tablets, capsules (each of which includes sustained release or timed release formulations), pills, powders, granules, elixirs, tinctures, suspensions, (including nanosuspensions, microsuspensions, spray-dried dispersions), syrups, and emulsions; sublingually; buccally; parenterally, such as by subcutaneous, intravenous, intramuscular, or intrasternal injection, or infusion techniques (*e.g.*, as sterile injectable aqueous or non-aqueous solutions or suspensions); nasally, including administration to the nasal membranes, such as by inhalation spray; topically, such as in the form of a cream or ointment; or rectally such as in the form of suppositories. They can be administered alone, but generally will be administered with a pharmaceutical carrier selected on the basis of the chosen route of administration and standard pharmaceutical practice.

[00148] The term "pharmaceutical composition" means a composition comprising a compound of the invention in combination with at least one additional pharmaceutically acceptable carrier. A "pharmaceutically acceptable carrier" refers to media generally accepted in the art for the delivery of biologically active agents to animals, in particular, mammals, including, *i.e.*, adjuvant, excipient or vehicle, such as diluents, preserving agents, fillers, flow regulating agents, disintegrating agents, wetting agents, emulsifying agents, suspending agents, sweetening agents, flavoring agents, perfuming agents, anti-bacterial agents, anti-fungal agents, lubricating agents and dispensing agents, depending on the nature of the mode of administration and dosage forms. Pharmaceutically acceptable carriers are formulated according to a number of factors well within the purview of those of ordinary skill in the art. These include, without limitation: the type and nature of the active agent being formulated; the subject to which the agent-containing composition is to be administered; the intended route of administration of the composition; and therapeutic indication being targeted. Pharmaceutically acceptable carriers include both aqueous and non-aqueous liquid media, as well as a variety of solid and semi-solid dosage forms. Such carriers can include a number of different ingredients and additives in addition to the active agent, such additional ingredients being included in the formulation for a variety of reasons, *e.g.*, stabilization of the active agent, binders, etc., well known to those of ordinary skill in the art. Descriptions of suitable pharmaceutically acceptable carriers, and factors involved in their selection, are found in

a variety of readily available sources such as, for example, Allen, L.V., Jr. et al., eds., *Remington: The Science and Practice of Pharmacy* (2 Volumes), 22nd Edition, Pharmaceutical Press (2012).

- [00149] The dosage regimen for the compounds of the present invention will, of course, vary depending upon known factors, such as the pharmacodynamic characteristics of the particular agent and its mode and route of administration; the species, age, sex, health, medical condition, and weight of the recipient; the nature and extent of the symptoms; the kind of concurrent treatment; the frequency of treatment; the route of administration, the renal and hepatic function of the patient, and the effect desired.
- 10 [00150] By way of general guidance, the daily oral dosage of each active ingredient, when used for the indicated effects, will range between about 0.01 to about 5000 mg per day, preferably between about 0.1 to about 1000 mg per day, and most preferably between about 0.1 to about 250 mg per day. Intravenously, the most preferred doses will range from about 0.01 to about 10 mg/kg/minute during a constant rate infusion.
- 15 Compounds of this invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three, or four times daily.
- [00151] The compounds are typically administered in admixture with suitable pharmaceutical diluents, excipients, or carriers (collectively referred to herein as pharmaceutical carriers) suitably selected with respect to the intended form of
- 20 administration, e.g., oral tablets, capsules, elixirs, and syrups, and consistent with conventional pharmaceutical practices.
- [00152] Dosage forms (pharmaceutical compositions) suitable for administration may contain from about 1 milligram to about 2000 milligrams of active ingredient per dosage unit. In these pharmaceutical compositions the active ingredient will ordinarily be
- 25 present in an amount of about 0.1-95% by weight based on the total weight of the composition.
- [00153] A typical capsule for oral administration contains at least one of the compounds of the present invention (250 mg), lactose (75 mg), and magnesium stearate (15 mg). The mixture is passed through a 60 mesh sieve and packed into a No. 1 gelatin
- 30 capsule.
- [00154] A typical injectable preparation is produced by aseptically placing at least one of the compounds of the present invention (250 mg) into a vial, aseptically freeze-drying

and sealing. For use, the contents of the vial are mixed with 2 mL of physiological saline, to produce an injectable preparation.

- [00155] The present invention includes within its scope pharmaceutical compositions comprising, as an active ingredient, a therapeutically effective amount of at least one of 5 the compounds of the present invention, alone or in combination with a pharmaceutical carrier. Optionally, compounds of the present invention can be used alone, in combination with other compounds of the invention, or in combination with one or more, preferably one to three, other therapeutic agent(s), *e.g.*, HMG-CoA reductase inhibitors or other pharmaceutically active material.

[00158] The compounds of the present invention may be employed in combination with additional therapeutic agent(s) selected from one or more, preferably one to three, of the following therapeutic agents in treating cholesterol biosynthesis inhibitor, particularly an HMG-CoA reductase inhibitor. Examples of suitable HMG-CoA reductase inhibitors include, but are not limited to, lovastatin, simvastatin, pravastatin, fluvastatin, atorvastatin, and rivastatin.

[00159] The term HMG-CoA reductase inhibitor is intended to include all pharmaceutically acceptable salt, ester, free acid and lactone forms of compounds which have HMG-CoA reductase inhibitory activity and, therefore, the use of such salts, esters, free acids and lactone forms is included within the scope of this invention. Compounds which have inhibitory activity for HMG-CoA reductase can be readily identified using assays well-known in the art.

[00160] The compounds of the invention may be used in combination with one or more, preferably one to three, of the following anti-diabetic agents depending on the desired target therapy. Studies indicate that diabetes and hyperlipidemia modulation can be further improved by the addition of a second agent to therapeutic regimen. Examples of anti-diabetic agents include, but are not limited to, sulfonylureas (such as chlorpropamide, tolbutamide, acetohexamide, tolazamide, glyburide, gliclazide, glynase, glimepiride, and glipizide), biguanides (such as metformin), thiazolidinediones (such as ciglitazone, pioglitazone, troglitazone, and rosiglitazone), and related insulin sensitizers, such as selective and non-selective activators of PPAR $\alpha$ , PPAR $\beta$  and PPAR $\gamma$ ; dehydroepiandrosterone (also referred to as DHEA or its conjugated sulphate ester, DHEA-SO<sub>4</sub>); anti-glucocorticoids; TNF $\alpha$  inhibitors;  $\alpha$ -glucosidase inhibitors (such as acarbose, miglitol, and voglibose), pramlintide (a synthetic analog of the human hormone amylin), other insulin secretagogues (such as repaglinide, gliquidone, and nateglinide), insulin, as well as therapeutic agents discussed above for treating atherosclerosis.

[00161] The compounds of the invention may be used in combination with one or more, preferably one to three, of the following anti-obesity agents selected from phenylpropanolamine, phentermine, diethylpropion, mazindol, fenfluramine, dexfenfluramine, phentiramine,  $\beta_3$ -adrenoreceptor agonist agents; sibutramine,

**[00162]** The above other therapeutic agents, when employed in combination with the compounds of the present invention may be used, for example, in those amounts indicated in the *Physicians' Desk Reference*, as in the patents set out above, or as otherwise determined by one of ordinary skill in the art.

10 **[00163]** Particularly when provided as a single dosage unit, the potential exists for a chemical interaction between the combined active ingredients. For this reason, when the compound of the present invention and a second therapeutic agent are combined in a single dosage unit they are formulated such that although the active ingredients are combined in a single dosage unit, the physical contact between the active ingredients is minimized (that is, reduced). For example, one active ingredient may be enteric coated. By enteric coating one of the active ingredients, it is possible not only to minimize the contact between the combined active ingredients, but also, it is possible to control the release of one of these components in the gastrointestinal tract such that one of these components is not released in the stomach but rather is released in the intestines. One of  
15 the active ingredients may also be coated with a material that affects a sustained-release throughout the gastrointestinal tract and also serves to minimize physical contact between the combined active ingredients. Furthermore, the sustained-released component can be additionally enteric coated such that the release of this component occurs only in the intestine. Still another approach would involve the formulation of a combination product  
20 in which the one component is coated with a sustained and/or enteric release polymer, and the other component is also coated with a polymer such as a low viscosity grade of hydroxypropyl methylcellulose (HPMC) or other appropriate materials as known in the art, in order to further separate the active components. The polymer coating serves to form an additional barrier to interaction with the other component.

25 **[00164]** These as well as other ways of minimizing contact between the components of combination products of the present invention, whether administered in a single dosage

form or administered in separate forms but at the same time by the same manner, will be readily apparent to those skilled in the art, once armed with the present disclosure.

[00165] The compounds of the present invention can be administered alone or in combination with one or more, preferably one to three, additional therapeutic agents. By 5 "administered in combination" or "combination therapy" it is meant that the compound of the present invention and one or more, preferably one to three, additional therapeutic agents are administered concurrently to the mammal being treated. When administered in combination, each component may be administered at the same time or sequentially in any order at different points in time. Thus, each component may be administered 10 separately but sufficiently closely in time so as to provide the desired therapeutic effect.

[00166] The compounds of the present invention are also useful as standard or reference compounds, for example as a quality standard or control, in tests or assays involving the endothelial lipase. Such compounds may be provided in a commercial kit, for example, for use in pharmaceutical research involving endothelial lipase or HDL 15 activity. For example, a compound of the present invention could be used as a reference in an assay to compare its known activity to a compound with an unknown activity. This would ensure the experimenter that the assay was being performed properly and provide a basis for comparison, especially if the test compound was a derivative of the reference compound. When developing new assays or protocols, compounds according to the 20 present invention could be used to test their effectiveness. The compounds of the present invention may also be used in diagnostic assays involving endothelial lipase.

[00167] The present invention also encompasses an article of manufacture. As used herein, article of manufacture is intended to include, but not be limited to, kits and packages. The article of manufacture of the present invention, comprises: (a) a first 25 container; (b) a pharmaceutical composition located within the first container, wherein the composition, comprises: a first therapeutic agent, comprising a compound of the present invention or a pharmaceutically acceptable salt form thereof; and, (c) a package insert stating that the pharmaceutical composition can be used for the treatment and/or prophylaxis of dyslipidemias and the sequelae thereof. In another embodiment, the 30 package insert states that the pharmaceutical composition can be used in combination (as defined previously) with a second therapeutic agent for the treatment and/or prophylaxis of dyslipidemias and the sequelae thereof. The article of manufacture can further

comprise: (d) a second container, wherein components (a) and (b) are located within the second container and component (c) is located within or outside of the second container. Located within the first and second containers means that the respective container holds the item within its boundaries.

- 5    [00168]    The first container is a receptacle used to hold a pharmaceutical composition. This container can be for manufacturing, storing, shipping, and/or individual/bulk selling. First container is intended to cover a bottle, jar, vial, flask, syringe, tube (*e.g.*, for a cream preparation), or any other container used to manufacture, hold, store, or distribute a pharmaceutical product.
- 10   [00169]    The second container is one used to hold the first container and, optionally, the package insert. Examples of the second container include, but are not limited to, boxes (*e.g.*, cardboard or plastic), crates, cartons, bags (*e.g.*, paper or plastic bags), pouches, and sacks. The package insert can be physically attached to the outside of the first container via tape, glue, staple, or another method of attachment, or it can rest inside 15   the second container without any physical means of attachment to the first container. Alternatively, the package insert is located on the outside of the second container. When located on the outside of the second container, it is preferable that the package insert is physically attached via tape, glue, staple, or another method of attachment. Alternatively, it can be adjacent to or touching the outside of the second container without being 20   physically attached.
- [00170]    The package insert is a label, tag, marker, etc. that recites information relating to the pharmaceutical composition located within the first container. The information recited will usually be determined by the regulatory agency governing the area in which the article of manufacture is to be sold (*e.g.*, the United States Food and Drug 25   Administration). Preferably, the package insert specifically recites the indications for which the pharmaceutical composition has been approved. The package insert may be made of any material on which a person can read information contained therein or thereon. Preferably, the package insert is a printable material (*e.g.*, paper, plastic, cardboard, foil, adhesive-backed paper or plastic, etc.) on which the desired information 30   has been formed (*e.g.*, printed or applied).

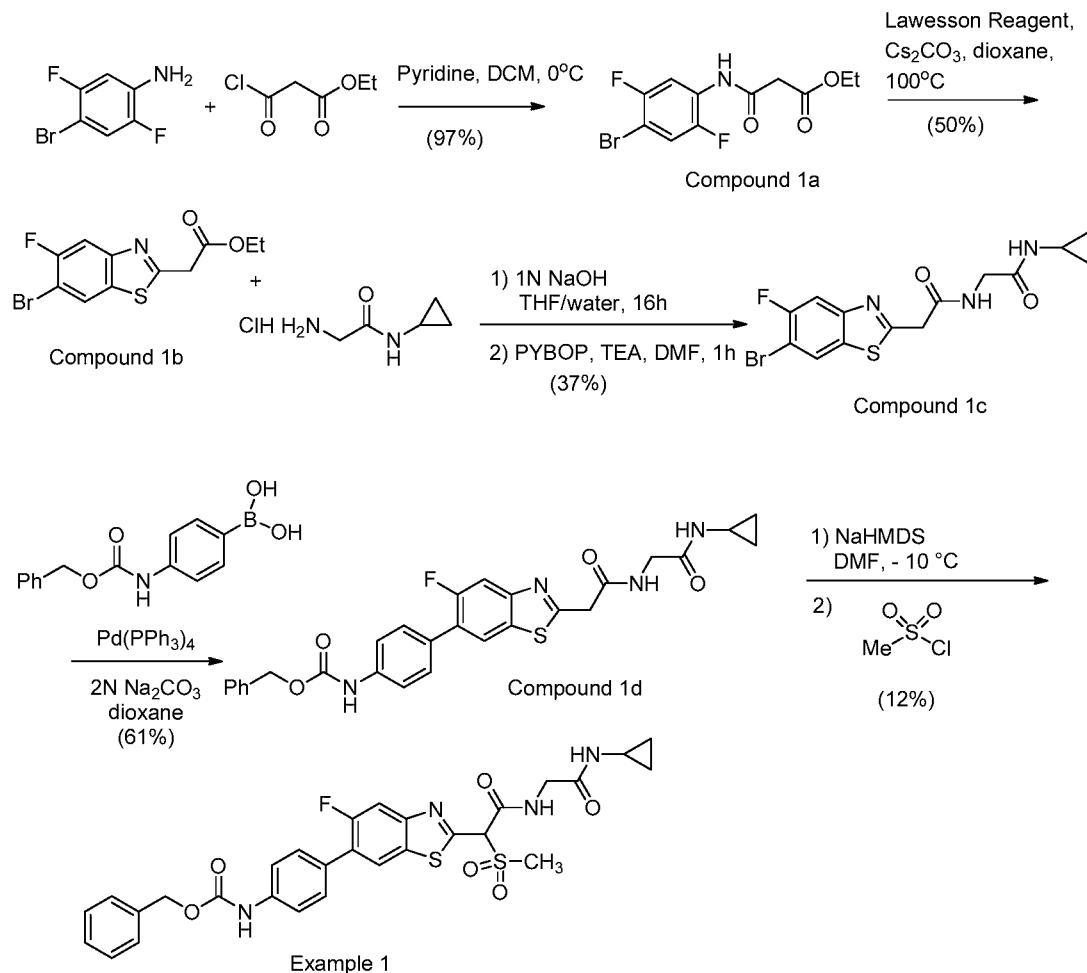

**[00171]** Other features of the invention should become apparent in the course of the above descriptions of exemplary embodiments that are given for illustration of the invention and are not intended to be limiting thereof.
